

# Motion Spell Checker

Catch typos before they ship — a spell-checking panel for After Effects.

---

Quick Start Guide

by Amir Anderson

Version 1.0

## What's in This Download

---

- **Amir Anderson Motion Spell Checker.zxp** — the plugin itself. This is the only file you need to install.
- **Motion\_Spell\_Checker\_Quick\_Start\_Guide.pdf** — this document.
- **INSTALL.md** — the short version of the install steps below.
- **LICENSE.txt** — usage terms.

## Installing the Plugin

---

**Requirements:** Adobe After Effects 2022 or later (macOS or Windows)

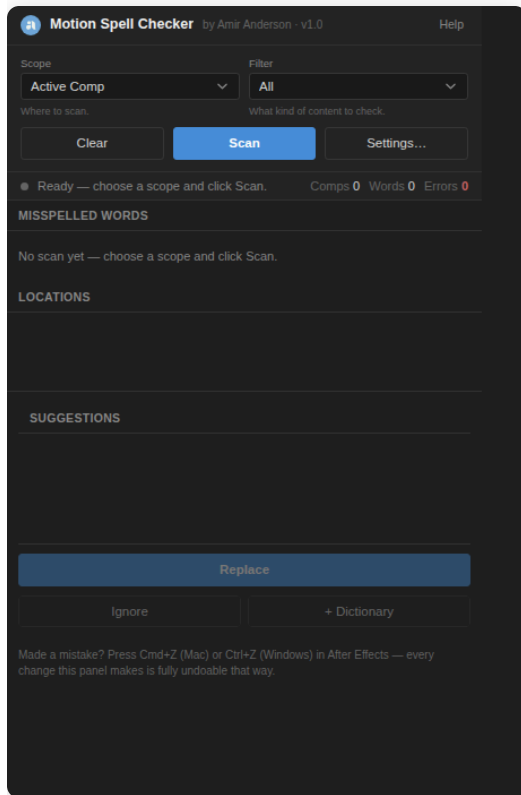

- 1 Download **Amir Anderson Motion Spell Checker.zxp**.
- 2 Install a ZXP installer app if you don't already have one — **ZXP Installer** (free) from [aescrpts.com](https://aescrpts.com/learn/zxp-installer) is recommended: [aescrpts.com/learn/zxp-installer](https://aescrpts.com/learn/zxp-installer). **Anastasiy's Extension Manager** is a free alternative.
- 3 Open ZXP Installer, drag **Amir Anderson Motion Spell Checker.zxp** into it, and click **Install**.
- 4 If a one-time "unverified developer" notice appears, that's expected — click through it. If macOS blocks it outright instead of just warning, open **System Settings** → **Privacy & Security**, find the message naming the blocked file, and click **Open Anyway**.
- 5 **Fully quit After Effects** (not just close a project) and reopen it.
- 6 Open it from **Window** → **Extensions** → **Amir Anderson Motion Spell Checker**.

## What It Does

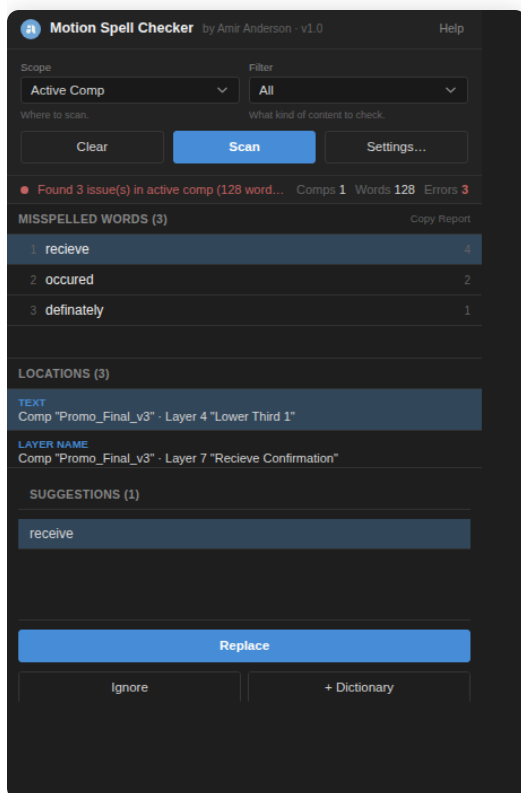

---

Motion Spell Checker scans your After Effects project for misspellings — in text layers, layer and composition names, marker comments, effect text fields, and expressions — then suggests corrections and fixes them in place with one click. Every scan can also draw a non-destructive highlight directly in the Composition viewer, so you can see exactly which layers need attention before you deliver.

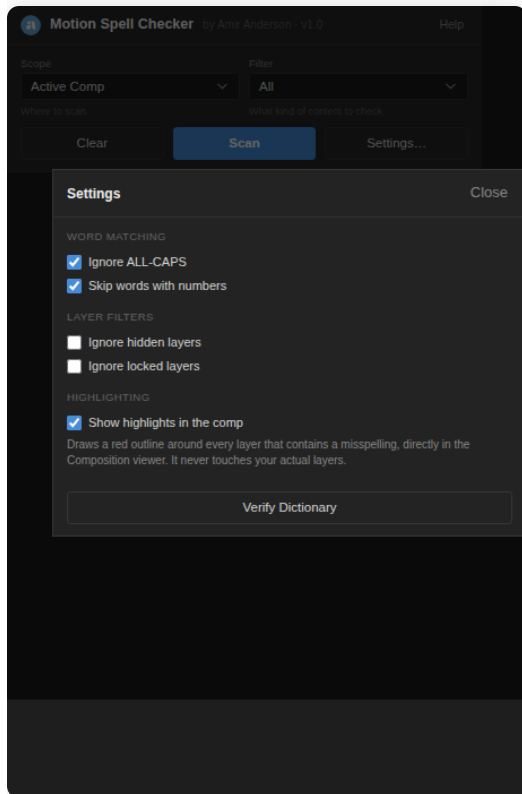

# The Interface

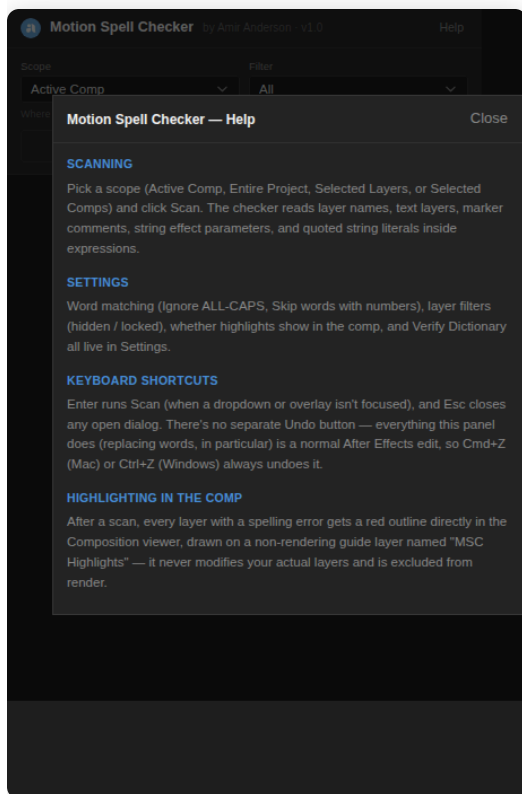

**Ready state.** Pick a Scope and Filter, then click Scan.

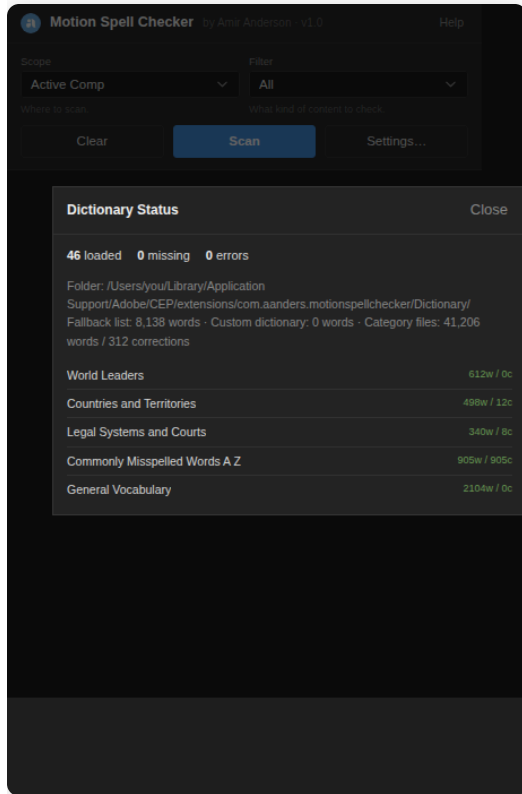

**Scan results.** Misspelled words, exactly where each one appears, and one-click suggestions.

**Settings.** Tune word matching, layer filters, and on-canvas highlighting.

**Built-in Help.** Every feature explained without leaving the panel.

**Verify Dictionary.** See exactly what word lists are loaded.

## Key Features

---

- **Flexible scope** — scan the active comp, entire project, selected layers, or selected comps.
- **Content filters** — narrow a scan to text, expressions, effects, markers, or comp/layer names.
- **One-click Replace** with ranked suggestions.
- **On-canvas highlighting** — a red outline in the Composition viewer, non-destructive and excluded from render.
- **Copy Report** — a plain-text QC summary for broadcast or client delivery sign-off.
- **Custom dictionary support** — ships with 46 built-in category word lists, extensible with your own.
- **Keyboard shortcuts** — Enter to scan, Esc to close dialogs, Cmd/Ctrl+Z (native After Effects undo) to revert any change.

# Troubleshooting

---

## **Plugin doesn't appear under Window → Extensions**

Make sure you fully quit and reopened After Effects — not just closed a project.

## **Nothing happens when you double-click the .zxp**

Install ZXP Installer or Anastasiy's Extension Manager first, then open the .zxp through that app instead.
